

## Week of 4/3/2023 Operations Update (14)

Mosquito activity has been above normal for this time of year. The bar graph below shows the total number of adult mosquitoes from all traps in the District for the past year (TTM).

Mosquito activity picked-up the last week of February, which is earlier than usual but not unheard of in Sub-Tropical Florida. *Coquilletidia perturbans* has been the dominant species of mosquito since late March. Typically, this species of permanent water species emerges from cattail swamps in Early April after over-wintering as larvae, but this year we began spraying to control this species in early March.

Zones hi-lighted in yellow were sprayed by truck this week.
